

Running Spazio (Ghost theme + local Ghost) after cloning

Repo: <https://github.com/hamzabread/spazio>

This repository is the Ghost theme (custom Pitch-based theme). The Ghost site runs separately via Ghost CLI.

Prerequisites

- Node.js (LTS, e.g. 18 or 20) and npm
- Ghost CLI globally: `npm install -g ghost-cli`
- A local Ghost install folder (e.g. `ghost-local`), placed next to the theme folder:

```
parent-folder/  
  spazio-pitch-multi/    <- clone of https://github.com/hamzabread/spazio (theme)  
  ghost-local/           <- Ghost instance (from colleague handoff zip or your own `ghost install`)
```

The bundled `npm run sync:ghost` script expects this layout: theme at `../ghost-local` relative to the repo root.

1) Clone the theme

```
git clone https://github.com/hamzabread/spazio.git spazio-pitch-multi  
cd spazio-pitch-multi  
npm install  
npm run build
```

- `npm run build` compiles CSS/JS into `assets/built/` (required for correct styling and `/about` hydration).

2) Unpack Ghost (local instance)

Unzip the provided `ghost-local` archive into a folder named `ghost-local`, sibling to `spazio-pitch-multi` (see structure above).

The handoff zip excludes `node_modules` (large, machine-specific). After unzipping, if ghost start fails, restore dependencies from that folder:

```
cd ghost-local  
ghost update
```

If problems persist, use a fresh Ghost CLI install and copy only `content/` from the handoff zip into it (keeps posts, theme uploads, images), or run `ghost install local` and re-import content as needed.

If you are setting up Ghost from scratch instead of the zip:

```
cd ..  
mkdir ghost-local && cd ghost-local  
ghost install local
```

Follow Ghost CLI prompts. Default site URL is often `http://localhost:2368`.

3) Install the theme into Ghost

Option A — `sync` script (recommended for development)

From inside `spazio-pitch-multi`:

```
npm run sync:ghost
```

This copies the theme to `../ghost-local/content/themes/spazio-pitch-multi/` and runs `ghost restart` in `../ghost-local`.

Option B — upload zip in Ghost Admin

1. Run `npm run zip` in `spazio-pitch-multi` → creates `spazio-pitch-multi.zip`
2. Ghost Admin → Settings → Design → Change theme → Upload theme

4) Activate the theme

Ghost Admin → Settings → Design → select `spazio-pitch-multi` (or the name shown) → Activate.

5) Run Ghost & open the site

```
cd ../ghost-local  
ghost start
```

Open `http://localhost:2368` (or your configured URL). Admin: `http://localhost:2368/ghost/`

6) Development workflow

- Edit theme files in `spazio-pitch-multi`
- Run `npm run build` after JS/CSS changes
- Run `npm run sync:ghost` to push to local Ghost and restart
- Optional: `npm run dev` for watch mode (Rollup)

Theme validation: `npm test` (runs `gscan`)

7) About page CMS behavior (short)

The `/about` route uses `page-about.hbs` and client-side hydration in `assets/js/aboutPage.js`. Content edited in Ghost (pages, toggles, HTML blocks) is injected via hidden `<template>` sources; refresh the browser after publishing.

Troubleshooting

- `sync:ghost` fails (path not found): Ensure `ghost-local` sits next to `spazio-pitch-multi` and the folder name matches.
- Styles or JS missing: Run `npm run build` in the theme, then `sync` or re-upload zip.
- Site won't start: In `ghost-local`, run `ghost doctor`, then `ghost start`.
- Wrong theme active: Ghost Admin → Design → activate the `spazio` theme.

Repo scripts (reference)

From `package.json`:

- `npm run build` — production build of assets
- `npm run dev` — dev watch
- `npm run sync:ghost` — rsync theme to `../ghost-local/.../spazio-pitch-multi` + `ghost restart`
- `npm run zip` — build + create theme zip for upload
